FORWARD-LOOKING STATEMENT

Certain statements contained in this presentation that are forward-looking in nature are based on the current beliefs and assumptions of the Company's management.

When used in this presentation, the words "may," "could," "should," "anticipate," "believe," "estimate," "expect," "intend," "plan," "predict," and similar expressions and their variants may be used to identify forward-looking statements. Such statements are valid only as of today, and we disclaim any obligation to update this information.

These statements are subject to known and unknown risks and uncertainties that may cause actual future experience and results to differ materially from the statements made. These statements are based on our current beliefs and expectations as to such future outcomes.

Project 81 Pre-Amble

- Project 81 is a 70,000 hectares contiguous land package covering 12 townships located 2-3 km north of the world class Kidd Creek Mine celebrating its 50th year of production.
- Airborne EM & MAG Geophysical Survey has recently been completed over the entire 12 townships.
- Airborne Gravity Gradiometer Survey is currently being conducted over the entire 12 townships
- There are in excess of 4000 anomalous responses with 1822 targets, resulting in 532 unique bedrock targets within 94 anomalous trends, throughout the Project Area
- In addition there are 22 Priority #1 trends (5 in Crawford) and 41 Priority #2 trends (17 in Crawford) that require follow-up exploration and refinement.
- Priority #1 trends are described as discrete, well-defined bedrock conductors with good strike length.
- Priority #2 trends are described as good, bedrock response with good strike length.

OTC.PK:NLPXF

- Crawford Township Property contains a total of 17 discrete HTEM conductor trends, some of which are very continuous and some which are discontinuous (not present on every line but having the same strike direction). There are both Cu-Pb-Zn and Ni-Cu-PGM trends to consider.
- Trend 15 is a good example of Cu-Pb-Zn potential. The trend has a strike length of 2.2 km and was tested with only one drillhole by Canico back in the 1960's – Drill hole 25049 intersected 0.46% Zn over 8.7'.
- Trend 7, is another example that covers a strongly magnetic feature that is likely a very large peridotite intrusion. This anomaly was never directly drill tested, but nearby drilling encountered over **1,500 ft** of mineralized host rock grading up to 0.4% Ni **(NI-CU-PGM Potential)**
- Trend 9 is an east to west conductor, located in the SE corner of The Crawford Township Property and has a strike length of 1.1 km. The best part of this anomaly was not drill tested. Drill holes 25073 & 25074 tested the eastern margin of this anomaly.
